

Vulnerability Testing

As a core component of any information security audit, BAI Security provides comprehensive vulnerability scanning of all areas associated with your production systems, including the core operating system, applications, and the underlying communication network. There are literally thousands of individual tests conducted during the process. Using proven methodologies developed by BAI Security and based on regulatory standards, the data collected from the scanning process is then correlated and evaluated to determine severity and ensure validity.

CORE AREAS OF THE BAI SECURITY AUDIT

Vulnerability Testing

Operating System Security Evaluation / Assessment
Social Engineering Evaluation / Assessment
Telco/War-dial Testing Evaluation / Assessment
Firewall / IDS / IPS Evaluation / Assessment
Antivirus Evaluation / Assessment
Wireless Evaluation / Assessment
VoIP Evaluation / Assessment
Remote Access Evaluation / Assessment
Security Policy Evaluation / Development
